Project 3: Quantum Algorithm as a PDE Solver for Computational Fluid Dynamics (CFD)

Team Name:

Start-QC

Team Members: Alex Stephane Tieta Mbiezie

WISER

Artificial Neural Networks

Task

Solve the **Burgers' Equation for 1D Shock Tube**:

$$\frac{\partial u}{\partial t} + \frac{u \partial u}{\partial x} = \frac{\nu \partial^2 u}{\partial x}$$

Domain: $x \in [0,1]$

IC: Riemann step $u(x, 0) = 1$ for $x \leq 0.5$, 0 otherwise

BC (Dirichlet): $u(0, t) = u_L$, $u(L, t) = u_R$ for all $t > 0$

Artificial Neural Networks

This is done using:

- a quantum solver: **Quantum Tensor-Network (QTN)** via Matrix Product States (MPSs) [1,2], and

- a classical solving technique: **Euler Forward + Upwind convection + Central diffusion** for comparison.

Machine Learning Background

## Numerical solution for both methods

Figure 1: Numerical solution for Burgers' equation: Classical (left) vs Quantum (right)

Artificial Neural Networks

Main results and perspectives

- Very long time execution duration for the quantum-inspired algorithm (about 12 min) compare to classical duration (a few second).
- Investigate the integration of coarse-grained evaluation or pixel sampling [1] in the time evolution loop for the quantum-inspired algorithm.
